

## Meta-easy updates

### V1.0.5

- Negative t-values and negative  $H_M^2$  are now allowed.
- 64bit compatible for Office 2010 and 2013

### V1.0.4

- Corrected a sign problem with method 6 (negative MD gave positive effect).

### V1.0.3

- Corrected the pooled SD formula in method 4, to take into account that we are using samples and not populations.

### V1.0.2

- Added appropriate error message when no effects can be calculated for any of the studies included for a meta-analysis

### V1.0.1

- Replaced  $\tau$  with tau for better display in systems where Greek fonts are not installed
- A note for the final forest plot (with diamonds) has been added, informing that the study weights correspond to the fixed-effects model (however, the appropriate weights have been used in each methods calculations, not the ones displayed)
- Corrected a potential division by zero error for meta-analyses of 6 to 9 studies
